

Setting up a VPN server using AWS

1. To set up a VPN server, at first we need to launch an EC2 instance. Which we are going to do in the AWS console. Navigate to EC2, select launch instance. I chose to leave the default settings as they are. So I chose for the default AMI (Amazon Linux 2) and the default instance type (t2.micro). Then I selected review and launch, while launching, make sure you choose to create a new keypair and download the keypair, so you can use it to connect with the ssh client.

Step 1: Choose an Amazon Machine Image (AMI)

An AMI is a template that contains the software configuration (operating system, application server, and applications) required to launch your instance. You can select an AMI provided by AWS, our user community, or the AWS Marketplace; or you can select one of your own AMIs.

Q Search for an AMI by entering a search term e.g. "Windows" ×

[Search by Systems Manager parameter](#)

Quick Start < 1 to 43 of 43 AMIs >

My AMIs

AWS Marketplace

Community AMIs

Amazon Linux 2 AMI (HVM) - Kernel 5.10, SSD Volume Type - ami-0142f6ace1c558c7d (64-bit x86) / ami-06391d741144b83c2 (64-bit Arm)

Amazon Linux
Free tier eligible

Amazon Linux 2 comes with five years support. It provides Linux kernel 5.10 tuned for optimal performance on Amazon EC2, systemd 219, GCC 7.3, Glibc 2.26, Binutils 2.29.1, and the latest software packages through extras. This AMI is the successor of the Amazon Linux AMI that is now under maintenance only mode and has been removed from this wizard.

Root device type: ebs Virtualization type: hvm ENA Enabled: Yes

Select

☒ 64-bit (x86)
☐ 64-bit (Arm)

Step 2: Choose an Instance Type

Amazon EC2 provides a wide selection of instance types optimized to fit different use cases. Instances are virtual servers that can run applications. They have varying combinations of CPU, memory, storage, and networking capacity, and give you the flexibility to choose the appropriate mix of resources for your applications. [Learn more](#) about instance types and how they can meet your computing needs.

Filter by: **All instance families** **Current generation** [Show/Hide Columns](#)

Currently selected: t2.micro (- ECUs, 1 vCPUs, 2.5 GHz, ~, 1 GiB memory, EBS only)

	Family	Type	vCPUs	Memory (GiB)	Instance Storage (GB)	EBS-Optimized Available	Network Performance	IPv6 Support
<input type="checkbox"/>	t2	t2.nano	1	0.5	EBS only	-	Low to Moderate	Yes
<input checked="" type="checkbox"/>	t2	t2.micro <small>Free tier eligible</small>	1	1	EBS only	-	Low to Moderate	Yes

1. Choose AMI 2. Choose Instance Type 3. Configure Instance 4. Add Storage 5. Add Tags 6. Configure Security Group 7. Review

Step 7: Review Instance Launch

Please review your instance launch details. You can go back to edit changes for each section. Click **Launch** to assign a key pair to your instance and complete the launch process.

⚠ Improve your instances' security. Your security group, launch-wizard-1, is open to the world.

Your instances may be accessible from any IP address. We recommend that you update your security group rules to allow access from known IP addresses only. You can also open additional ports in your security group to facilitate access to the application or service you're running, e.g., HTTP (80) for web servers. [Edit security groups](#)

Select an existing key pair or create a new key pair ×

A key pair consists of a **public key** that AWS stores, and a **private key file** that you store. Together, they allow you to connect to your instance securely. For Windows AMIs, the private key file is required to obtain the password used to log into your instance. For Linux AMIs, the private key file allows you to securely SSH into your instance. Amazon EC2 supports ED25519 and RSA key pair types.

Note: The selected key pair will be added to the set of keys authorized for this instance. [Learn more about removing existing key pairs from a public AMI.](#)

Create a new key pair ▼

Key pair type

☒ RSA ☐ ED25519

Connect to instance Info

Connect to your instance i-048ff24f7988d9a79 using any of these options

EC2 Instance Connect

Session Manager

SSH client

EC2 Serial Console

Instance ID

i-048ff24f7988d9a79

- Open an SSH client.
- Locate your private key file. The key used to launch this instance is vpnkey.pem
- Run this command, if necessary, to ensure your key is not publicly viewable.

```
chmod 400 vpnkey.pem
```

- Connect to your instance using its Public DNS:

```
ec2-34-209-125-88.us-west-2.compute.amazonaws.com
```

Example:

```
ssh -i "vpnkey.pem" ec2-user@ec2-34-209-125-88.us-west-2.compute.amazonaws.com
```

Note: In most cases, the guessed user name is correct. However, read your AMI usage instructions to check if the AMI owner has changed the default AMI user name.

- I opened command prompt, navigated to the directory in which the keypair was downloaded, then pasted the example link and then pressed enter to make connection. Type 'yes' when asked if you're sure to continue connecting.

```
C:\Users\steel>cd downloads
C:\Users\steel\Downloads>ssh -i "vpnkey.pem" ec2-user@ec2-34-209-125-88.us-west-2.compute.amazonaws.com
The authenticity of host 'ec2-34-209-125-88.us-west-2.compute.amazonaws.com (34.209.125.88)' can't be established.
ECDSA key fingerprint is SHA256:GfZAtxRthRL00cKZfbUxXFJUN92LHNPfWxEgSGAcXeLs.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'ec2-34-209-125-88.us-west-2.compute.amazonaws.com,34.209.125.88' (ECDSA) to the list of known hosts.

 _ _ | _ | _ )

 _ | \ | _ |
      Amazon Linux 2 AMI

https://aws.amazon.com/amazon-linux-2/
[ec2-user@ip-172-31-23-212 ~]$
```

- Before we do anything else, we are going to switch to the root user to make sure that we have all permissions to run any necessary command. We can do this by using the following command: `$ sudo su root`

I prefer to start in the root directory, to navigate to the root directory use command:

```
$ cd
```

```
[ec2-user@ip-172-31-23-212 ~]$ sudo su root
[root@ip-172-31-23-212 ec2-user]# cd
[root@ip-172-31-23-212 ~]# yum update -y
```

5. Now we are going to make sure that all repositories and packages we might need are up to date by using this command:

```
$ yum update -y
```

We will need the OpenVPN package to do this exercise, which can not be downloaded from the default repositories, it is available in the EPEL (Extra Packages for Enterprise Linux) repository. To enable the EPEL repository we run this command:

```
$ yum install epel-release -y
```

By using this command I found out there was no epel-release package available. Reading the output I found out the following command should work:

```
$ sudo amazon-linux-extras install epel
```

And indeed, it did work!

Then update all repositories and packages again:

```
$ yum update -y
```

Finally install OpenVPN with the following command:

```
$ yum install -y openvpn
```

```
Transaction test succeeded
Running transaction
  Installing : pkcs11-helper-1.11-3.el7.x86_64 1/3

Dependency Installed:
  lzo.x86_64 0:2.06-8.amzn2.0.4 pkcs11-helper.x86_64 0:1.11-3.el7

Complete!
[root@ip-172-31-23-212 ec2-user]#
```

As you can see the OpenVPN package is installed!

6. In the next step we are going to install easy rsa, which we will need to generate a SSL key pair and a PKI Certificate Authority (CA). Use the following command to install easy rsa:

```
$ yum install -y wget
```

Then download the latest version of the CLI utility, which is 3.0.8 at the moment. You can do this by using the following command:

```
$ wget https://github.com/OpenVPN/easy-rsa/archive/v3.0.8.tar.gz
```

```
--2021-11-21 19:58:14-- https://codeload.github.com/OpenVPN/easy-rsa/tar.gz/v3.0.8
Resolving codeload.github.com (codeload.github.com)... 192.30.255.120
Connecting to codeload.github.com (codeload.github.com)[192.30.255.120]:443... connected.
HTTP request sent, awaiting response... 200 OK
Length: unspecified [application/x-gzip]
Saving to: 'v3.0.8.tar.gz'

[ <=> ] 3,864,366 8.04MB/s in 0.5s

2021-11-21 19:58:15 (8.04 MB/s) - 'v3.0.8.tar.gz' saved [3864366]

[root@ip-172-31-23-212 ec2-user]#
```

In the output you can check if the archive file is successfully saved or not. Now we need to extract the file, which is possible by using the following command:

```
$ tar -xvf v3.0.8.tar.gz
```

7. In the next step we will create a new directory (openvpn) and move into it straightaway. Use command:

```
$ cd /etc/openvpn/
```

Then create a subdirectory in directory openvpn by using command:

```
$ mkdir /etc/openvpn/easy-rsa
```

By listing it with command: `$ ll` you can check if the directory was created successful.

```
[root@ip-172-31-23-212 ~]# tar -xvf v3.0.8.tar.gz
[root@ip-172-31-23-212 ~]# cd /etc/openvpn/
[root@ip-172-31-23-212 openvpn]# mkdir /etc/openvpn/easy-rsa
[root@ip-172-31-23-212 openvpn]# ll
total 0
drwxr-x--- 2 root openvpn 6 Apr 21 2021 client
drwxr-xr-x 2 root root 6 Nov 21 20:15 easy-rsa
drwxr-x--- 2 root openvpn 6 Apr 21 2021 server
[root@ip-172-31-23-212 openvpn]#
```

And then move the earlier extracted directory into /etc/openvpn/easy-rsa by using command:

```
$ mv /root/easy-rsa-3.0.8 /etc/openvpn/easy-rsa
```

Move into directory easy rsa with command: `$ cd easy-rsa`

Then use `$ ll` again to list and check if the directory was moved successfully.

```
[root@ip-172-31-23-212 openvpn]# mv /root/easy-rsa-3.0.8 /etc/openvpn/easy-rsa
[root@ip-172-31-23-212 openvpn]# cd easy-rsa
[root@ip-172-31-23-212 easy-rsa]# ll
total 0
drwxrwxr-x 8 root root 311 Sep 16 2020 easy-rsa-3.0.8
[root@ip-172-31-23-212 easy-rsa]#
```

8. Now we are going to configure the OpenVPN. Before moving on, make sure you return to the root directory by using command `$ cd`. The first step is to copy the sample server.conf file from OpenVPN's documentation directory:

```
$ cp /usr/share/doc/openvpn-2.4.9/sample/sample-config-files/server.conf /etc/openvpn
```

If you cannot find the OpenVPN sample configuration file, search for its location using the find command:

```
$ find / -name server.conf
```

Then, open the copied configuration file with a text editor of your choice:

```
$ vi /etc/openvpn/server.conf
```

You should see the following in the file:

```
#####
# Sample OpenVPN 2.0 config file for      #
# multi-client server.                   #
#                                       #
# This file is for the server side       #
# of a many-clients <-> one-server      #
# OpenVPN configuration.                 #
#                                       #
# OpenVPN also supports                  #
# single-machine <-> single-machine     #
# configurations (See the Examples page  #
# on the web site for more info).       #
#                                       #
# This config should work on Windows    #
# or Linux/BSD systems. Remember on     #
# Windows to quote pathnames and use    #
# double backslashes, e.g.:             #
# "C:\\Program Files\\OpenVPN\\config\\foo.key" #
#                                       #
# Comments are preceded with '#' or ';'  #
#####

# Which local IP address should OpenVPN
# listen on? (optional)
;local a.b.c.d

# Which TCP/UDP port should OpenVPN listen on?
# If you want to run multiple OpenVPN instances
# on the same machine, use a different port
"/etc/openvpn/server.conf" [noel] 315L, 10784C
```

To set up the basic configurations, we need to uncomment a few lines in this file. To uncomment just remove the ; (semicolons) or # hashtags.

- topology subnet (makes the OpenVPN installation function as a subnetwork)
- push "redirect-gateway def1 bypass-dhcp" (instructs the client to redirect traffic through the OpenVPN server)
- push "dhcp-option DNS 208.67.222.222" (uses an OpenDNS resolver to connect to OpenVPN)
- push "dhcp-option DNS 208.67.220.220" (uses an OpenDNS resolver to connect to OpenVPN)
- user nobody (runs OpenVPN with no privileges)
- group nobody (runs OpenVPN with no privileges)

Then, generate a static encryption key to enable TLS authentication. To do that, locate the line `tls-auth ta.key 0` and comment it by adding ; in front of it. Then, add a new line under it:

```
# The server and each client must have
# a copy of this key.
# The second parameter should be '0'
# on the server and '1' on the clients.
;tls-auth ta.key 0 # This file is secret
tls-crypt myvpn.tlsauth
# Select a cryptographic cipher.
# This config item must be copied to
```

Save the changes and exit the file. Now we can generate the static encryption key which we just specified in the configuration file. Use command:

```
$ openvpn --genkey --secret /etc/openvpn/myvpn.tlsauth
```

9. Now we have configured the OpenVPN we are going to generate keypair and certificate. At first we are creating a vars configuration file using `vars.example` which is stored in `the easy-rsa/easy-rsa-3.0.8/easyrsa3`. To move into the right directory use:
- ```
$ cd /etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3
```

Use command: `$ ls` to check if there is any file named `vars.example`

```
[root@ip-172-31-23-212 ~]# cd /etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3
[root@ip-172-31-23-212 easyrsa3]# ls
easyrsa openssl-easyrsa.cnf vars.example x509-types
[root@ip-172-31-23-212 easyrsa3]#
```

Copy the sample file `vars.example` under the name `vars`:

```
$ cp vars.example vars
```

```
[root@ip-172-31-23-212 easyrsa3]# cp vars.example vars
[root@ip-172-31-23-212 easyrsa3]# ls
easyrsa openssl-easyrsa.cnf vars vars.example x509-types
[root@ip-172-31-23-212 easyrsa3]#
```

Open the `vars` file in a text editor:

```
$ vi vars
```

The file looks like this:

```
Easy-RSA 3 parameter settings

NOTE: If you installed Easy-RSA from your distro's package manager, don't edit
this file in place -- instead, you should copy the entire easy-rsa directory
to another location so future upgrades don't wipe out your changes.

HOW TO USE THIS FILE
#
vars.example contains built-in examples to Easy-RSA settings. You MUST name
this file 'vars' if you want it to be used as a configuration file. If you do
not, it WILL NOT be automatically read when you call easyrsa commands.
#
It is not necessary to use this config file unless you wish to change
operational defaults. These defaults should be fine for many uses without the
need to copy and edit the 'vars' file.
#
```

Scroll through it, find the following lines, uncomment them by removing the `#` and replace the default values with your own information.

```
#set_var EASYRSA_REQ_COUNTRY "US"
#set_var EASYRSA_REQ_PROVINCE "California"
#set_var EASYRSA_REQ_CITY "San Francisco"
#set_var EASYRSA_REQ_ORG "Copyleft Certificate Co"
#set_var EASYRSA_REQ_EMAIL "me@example.net"
#set_var EASYRSA_REQ_OU "My Organizational Unit"
```

Then add the following lines:

```
export KEY_NAME="server"
export KEY_CN=openvpn.yourdomain.com
```

Save your changes and exit the file.

Now we have adjusted the configuration file, we can start generating the key-pair and certificate. But first we will clean up any previous keys. Use command:

```
$./easyrsa clean-all
```

```
[root@ip-172-31-23-212 easyrsa3]# ./easyrsa clean-all

Note: using Easy-RSA configuration from: /etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3/vars

init-pki complete; you may now create a CA or requests.
Your newly created PKI dir is: /etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3/pki

[root@ip-172-31-23-212 easyrsa3]#
```

Now we can move on to building the certificate authority with the `built-ca` script. Use command:

```
$./easyrsa build-ca
```

You will be asked to set a CA Key Passphrase and a common name for your CA. To skip this part use the following command instead of the command above:

```
$./easyrsa build-ca nopass
```

```
[root@ip-172-31-23-212 easyrsa3]# ./easyrsa build-ca nopass

Note: using Easy-RSA configuration from: /etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3/vars
Using SSL: openssl OpenSSL 1.0.2k-fips 26 Jan 2017
Generating RSA private key, 2048 bit long modulus
.....+++
.....+++
e is 65537 (0x10001)
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.

Common Name (eg: your user, host, or server name) [Easy-RSA CA]:VPNSA

CA creation complete and you may now import and sign cert requests.
Your new CA certificate file for publishing is at:
/etc/openvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3/pki/ca.crt

[root@ip-172-31-23-212 easyrsa3]#
```

Create a key and certificate for the server:

```
$./easyrsa build-server-full server
```

You will be asked to fill in a passphrase.

Now let us generate a Diffie-Hellman key exchange file by using the command:

```
$./easyrsa gen-dh
```

We also need a certificate for each client. You can generate them on the server and then copy them to the client machine. Create a certificate and key for client1 (replace with any name) with the following command:

```
$./easyrsa build-client-full client1
```

```
[root@ip-172-31-23-212 easyrsa3]# ./easyrsa build-server-full server
Note: using Easy-RSA configuration from: /etc/openssl/easy-rsa/easy-rsa-3.0.8/easyrsa3/vars

[root@ip-172-31-23-212 easyrsa3]#
```

After creating the keys and certificates, copy them from the pki directory into the openvpn directory. First navigate to the pki directory:

```
$ cd /etc/openvpn/easy-rsa/easyrsa3/pki
```

We need to copy the following 4 files:

- ca.crt
- dh.pem
- ca.key
- server.key

The first two files are stored in the **pki** directory and the other two files are in the subdirectory **pki/private**.

Copy ca.crt and dh.pem first, use command:

```
$ cp ca.crt dh.pem /etc/opensvpn
```

Then move into the private directory:

```
$ cd private
```

Copy ca.key and server.key to the opensvpn directory:

```
$ cp ca.key server.key /etc/opensvpn
```

```
[root@ip-172-31-23-212 easyrsa3]# cd /etc/opensvpn/easy-rsa/easy-rsa-3.0.8/easyrsa3/pki
[root@ip-172-31-23-212 pki]# ls
ca.crt index.txt index.txt.old private revoked serial.old
certs_by_serial index.txt.attr issued renewed safessl-easyrsa.cnf
dh.pem index.txt.attr.old openssl-easyrsa.cnf reqs serial
[root@ip-172-31-23-212 pki]# cp ca.crt dh.pem /etc/opensvpn
[root@ip-172-31-23-212 pki]# cd private
[root@ip-172-31-23-212 private]# ls
ca.key server.key Shagofta.key
[root@ip-172-31-23-212 private]# cp ca.key server.key /etc/opensvpn
[root@ip-172-31-23-212 private]#
```

10. Now we have generated the keys and certificates, we are moving on to the next step. The firewall and routing configuration. At first we are going to install the firewall package by using command:

```
$ yum install -y firewalld
```

```
Installed:
 firewalld.noarch 0:0.4.4-6.amzn2.0.1

Dependency Installed:
 dbus-glib.x86_64 0:0.100-7.2.amzn2 dbus-python.x86_64 0:1.1.1-9.amzn2.0.2
 ebttables.x86_64 0:2.0.10-16.amzn2.0.1 firewalld-filesystem.noarch 0:0.4.4-6.amzn2.0.1
 gobject-introspection.x86_64 0:1.56.1-1.amzn2 ipset.x86_64 0:6.29-1.amzn2.0.1
 ipset-libs.x86_64 0:6.29-1.amzn2.0.1 libselinux-python.x86_64 0:2.5-12.amzn2.0.2
 python-decorator.noarch 0:3.4.0-3.amzn2 python-firewall.noarch 0:0.4.4-6.amzn2.0.1
 python-gobject-base.x86_64 0:3.22.0-1.amzn2.1 python-slip.noarch 0:0.4.0-4.amzn2
 python-slip-dbus.noarch 0:0.4.0-4.amzn2

Complete!
[root@ip-172-31-23-212 ~]#
```

When the installation is completed you need to enable and start the firewall service. Use the following commands:

```
$ systemctl enable firewalld
```

```
$ systemctl start firewalld
```

Then you can check the status by using command:

```
$ systemctl status firewalld
```

```

complete!
[root@ip-172-31-23-212 ~]# systemctl enable firewalld
[root@ip-172-31-23-212 ~]# systemctl start firewalld
[root@ip-172-31-23-212 ~]# systemctl status firewalld
● firewalld.service - firewalld - dynamic firewall daemon
 Loaded: loaded (/usr/lib/systemd/system/firewalld.service; enabled; vendor preset: enabled)
 Active: active (running) since Sun 2021-11-21 21:49:22 UTC; 21s ago
 Docs: man:firewalld(1)
 Main PID: 866 (firewalld)
 CGroup: /system.slice/firewalld.service
 └─866 /usr/bin/python -Es /usr/sbin/firewalld --nofork --nopid

Nov 21 21:49:22 ip-172-31-23-212.us-west-2.compute.internal systemd[1]: Starting firewalld - dynamic firewall daemon...
Nov 21 21:49:22 ip-172-31-23-212.us-west-2.compute.internal systemd[1]: Started firewalld - dynamic firewall daemon.
Hint: Some lines were ellipsized, use -l to show in full.
[root@ip-172-31-23-212 ~]#

```

Once you made sure you have an active running firewall, we need to add the openvpn service to the list of services firewalld allows in the active zone. check the active zones by using command:

```
$ firewall-cmd --get-active-zone
```

In this case there was no output. So in the following command add the zone and directly add the openvpn service to the zone too:

```
$ firewall-cmd --zone=public --add-service openvpn
```

Then make it permanent:

```
$ firewall-cmd --zone=public --add-service openvpn --permanent
```

Check if the service is successfully added:

```
$ firewall-cmd --list-services --zone=public
```

```

Hint: Some lines were ellipsized, use -l to show in full.
[root@ip-172-31-23-212 ~]# firewall-cmd --get-active-zone
[root@ip-172-31-23-212 ~]# firewall-cmd --zone=public --add-service openvpn
success
[root@ip-172-31-23-212 ~]# firewall-cmd --zone=public --add-service openvpn --permanent
success
[root@ip-172-31-23-212 ~]# firewall-cmd --list-services --zone=public
ssh dhcpv6-client openvpn
[root@ip-172-31-23-212 ~]#

```

Then add a masquerade to the runtime instance:

```
$ firewall-cmd --add-masquerade
```

Make it permanent:

```
$ firewall-cmd --add-masquerade --permanent
```

And verify if the masquerade was added:

```
$ firewall-cmd --query-masquerade
```

```

[root@ip-172-31-23-212 ~]# firewall-cmd --add-masquerade
success
[root@ip-172-31-23-212 ~]# firewall-cmd --add-masquerade --permanent
success
[root@ip-172-31-23-212 ~]# firewall-cmd --query-masquerade
yes
[root@ip-172-31-23-212 ~]#

```

11. Now move on to routing to your OpenVPN subnet. Create a variable for the primary network interface used by your server. In the following command the variable is named VAR.

```
$ VAR=$(ip route get 208.67.222.222 | awk 'NR==1 {print $(NF-2)}')
root@ip-172-31-23-212 ~]# VAR=$(ip route get 208.67.222.222 | awk 'NR==1 {print $(NF-2)}')
root@ip-172-31-23-212 ~]#
```

Then permanently add the routing rule using the created variable:

```
$ firewall-cmd --permanent --direct --passthrough ipv4 -t nat -A POSTROUTING -s 10.8.0.0/24
-o $VAR -j MASQUERADE
```

```
root@ip-172-31-23-212 ~]# firewall-cmd --permanent --direct --passthrough ipv4 -t nat -A POSTROUTING -s 10.8.0.0/24 -o
$VAR -j MASQUERADE
success
root@ip-172-31-23-212 ~]#
```

Then reload firewalld so the changes can take place:

```
$ firewall-cmd --reload
```

Move on to routing all web traffic from the client to the server's IP address by enabling IP forwarding. Open the sysctl.conf file:

```
$ vi /etc/sysctl.conf
```

Add the following line at the top of the file:

```
net.ipv4.ip_forward = 1
```

```
net.ipv4.ip_forward = 1
```

```
sysctl settings are defined through files in
/usr/lib/sysctl.d/, /run/sysctl.d/, and /etc/sysctl.d/.
#
Vendors settings live in /usr/lib/sysctl.d/.
To override a whole file, create a new file with the same in
/etc/sysctl.d/ and put new settings there. To override
only specific settings, add a file with a lexically later
name in /etc/sysctl.d/ and put new settings there.
#
For more information, see sysctl.conf(5) and sysctl.d(5).
```

Now restart and check the service:

```
$ systemctl restart network.service:
```

```
$ systemctl status network.service:
```

```
[root@ip-172-31-23-212 etc]# systemctl restart network.service
[root@ip-172-31-23-212 etc]# systemctl status network.service
● network.service - LSB: Bring up/down networking

Hint: Some lines were ellipsized, use -l to show in full.
[root@ip-172-31-23-212 etc]#
```

12. Now it's time to start the OpenVPN and check if it is working.

To start the OpenVPN service, run the command:

```
$ systemctl -f start openvpn@server.service
```

Then, enable it to start up at boot by running:

```
$ systemctl -f enable openvpn@server.service
```

Verify the service is active with:

```
$ systemctl status openvpn@server.service
```

```
[root@ip-172-31-23-212 etc]# systemctl -f start openvpn@server.service
Job for openvpn@server.service failed because the control process exited with error code. See "systemctl status openvpn@server.service" and "journalctl -xe" for details.
[root@ip-172-31-23-212 etc]#
```

Unfortunately I was not able to start the OpenVPN service. I tried to find out how to solve the error, but without success till now. This document will be updated after the solution is found!
